To use this within the application, we need to import few modules from the corner library. You may also want to take a look at the following articles to learn more: [Angular Input Matinput Type = "Text" formcontrolname = "Field Name" ID = "Name"](#) As you can see in the syntax above we can try in the syntax above To use `FormControlName` to create our form to take user input. If 'header-area' is an angular component, then verify that it is part of this module. Guided shapes and template validation is easy to implement, readable, scalable and easily maintainable by the user did not require much configuration in place in order to implement it. > 2. ReactiveFormModule: this module must be imported and present within the component module where we want to implement this. My Planner module looks like this: @NgModule({declarations: [PlannerComponent, HeaderAreaComponent, NavbaareaComponent, EreignisbaareaComponent, GRAPAREComponent, NVD3], imports: [RouterModule, CommonModule, ModalModule, Bootstrap, [PlannerComponent]]}) Exports PlannerModule class {} and As far as I understand the concept of modules in NG2, module parts are declared in "Declarations". MAT TIP: This is used to show the hint to the user if they are entering something wrong. Here we discuss the introduction, how does shape validation work in angular material? Module Code: import { NgModule } from '@angular/core'; import { MatFormFieldModule } from '@angular/material/form-field'; @NgModule({ exports: [MatFormFieldModule] }) EXPORT class {} If the form is invalid, this message will be displayed on the screen in red. In Angular we can also show suggestions for the user using the selection form below the form in the Mat field. For completeness, completeness, IS THE PLANNER COMPONENT: @Component({selector: 'Planner', providers: [CalculationService], templateUrl: './planner.component.html', styleUrls: ['./planner.component.scss']}) Export Default Class PlannerComponent {} and the headerAreaComponent: @Component({selector: 'header-area', templateUrl: './header-area.component.html', styleUrls: ['./header-area.component.scss']}) Export Default Class HeaderAreaComponent {} The -tag is Located in Planner.component.html: ... if we have forgotten this error occurs and the code will not work. If 'header-area' is a web component then add "custom-elements" to the @NgModule.schema of this component to suppress this message. (" [Error ->] < Header-area > "); plannerComponent @ 1: 2 I don't understand why the component is not found. With the attached suggestion message. Syntax: Suggestion message Example of validation of the shape Angle material The aforementioned example is reported: a. For this we need to have the validation of the module, which improves the data that must be entered by the user. So, to validate user data at the client level, we need a validation of the module. Recommended articles This is a guide to validation of the modules in corner material. We simply need to put the components inside the Inbuild material library, after any validation approach we can choose. Syntax: error message 3. In angular material we have different selectors that can be used to show our error messages. Did I do something wrong? Let's take an example where the developers asked the user to enter his phone number, but mistakenly provided few strings with it. Angular Material Form Validation Syntax As we know, this is something that is not present within the material library, but we still have a module that helps us easily create our own forms.
